

# HW 05 – Create a Number Guessing Game

**Write a Program that does the following:**

Creates a variable called guess, give it an integer value of your choosing.

Asks the user to input an integer:

If the Input is greater than variable 'guess', it should print "Your guess was incorrect, the number **X** you entered is too large, try again", where **X** is the input value;

else if it is less than the variable 'guess', it should display "Your guess is incorrect, the number **X** is too small; try again", where **X** is the input value;

else, it should display "You guessed it right"

Important: In all of the above cases, your program should display what the user of the program entered as input initially.
